

OVOLYN

The Autonomous Bank for AI Agents

PROGRAMMABLE MONEY HACKATHON · BUILT ON ARC · 2026

TRACKS — AGENTIC ECONOMY · DEFI

LIVE — [OVOLYN.XYZ](https://ovolyn.xyz)

AI agents earn and spend money. Their money has nowhere to live.

01

Idle

Agent funds sit in raw wallets earning nothing — a treasury that sleeps while the agent works.

02

Ungoverned

A private key is all-or-nothing. No limits, no allowlists, no budgets — one bad decision drains everything.

03

High-friction

Gas tokens to babysit, chains to bridge, manual top-ups. Machine-speed commerce on human-speed rails.

A bank account built for an autonomous depositor.

Deposit

Fund an agent account with USDC from any chain.

CCTP v2 · Bridge Kit

Earn

Idle balances above a threshold sweep into tokenized treasury yield.

USYC

Govern

A human CFO sets policy: per-tx limits, allowlists, budgets. Out-of-bounds spends are blocked.

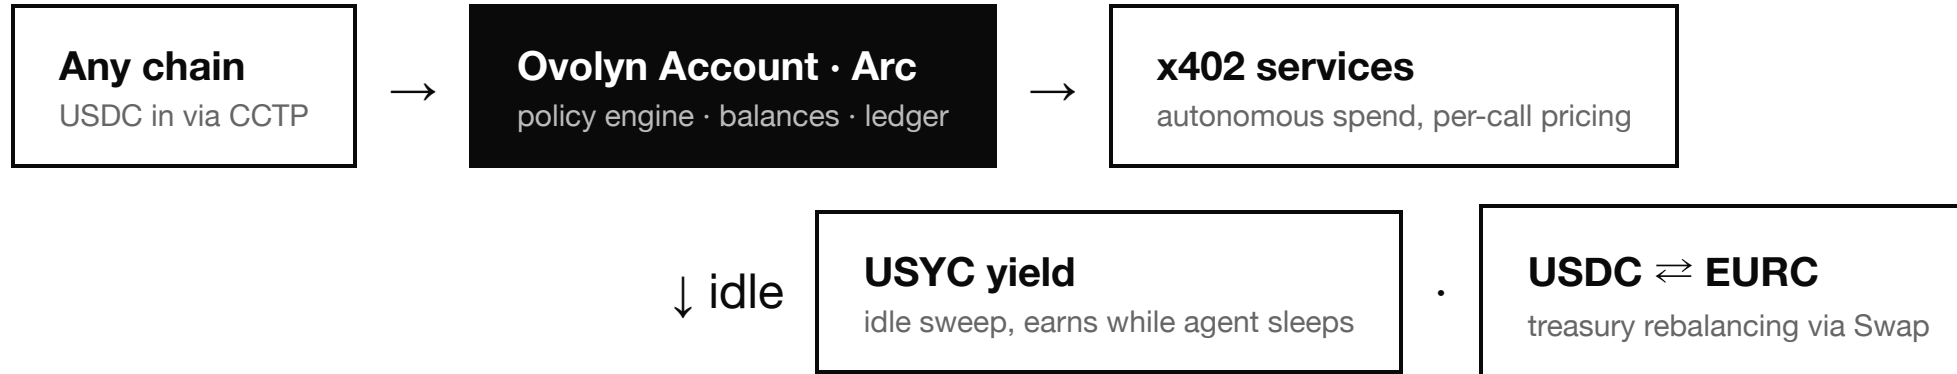

Circle Agent Wallets

Spend

The agent pays for services autonomously, within policy, at machine speed.

x402 Nanopayments · Gateway

One account. Four money flows.

Every flow is policy-checked. Every movement lands on one auditable balance sheet: revenue in, yield accrued, spend out — gas included, denominated in USDC end to end.

The only chain where a bank for agents is native, not bolted on.

USDC is the gas token

The treasury never touches a volatile asset — one currency for balances, payments and fees.

Swap — Arc Testnet exclusive

USDC/EURC treasury rebalancing runs on the only testnet where Circle Swap exists.

Sub-second settlement

Machine-speed spending needs machine-speed finality. Our Gateway deposit confirmed instantly.

First-party Circle stack

Agent Wallets, Gateway, CCTP, USYC — the entire bank is composed from native primitives.

One button. Four flows. 76 seconds on Arc Testnet.

DEPOSIT	+3.000000	Sepolia → Arc · CCTP V2 fast · mint 0x34045f8995...	50s
EARN	-4.000000	idle 14.00 > threshold 10.00 → minted 3.530454 USYC	17s
SPEND	-0.001000	Arc Gas Oracle · HTTP 402 → 200 · settled via Gateway	7s
GOVERN	REFUSED	Deep Market Analysis \$0.05 > per-tx limit \$0.01	2s

The 50 seconds is Sepolia's block time and the cross-chain attestation — **not Arc**. Every movement on the Arc side, including the refusal, settles in seconds and lands on one auditable ledger.

✓ Live, not a mock ✓ Every hash on Arcscan ✓ Open source

The agent adapts. It does not overreach.

<i>“What does it cost to transact on Arc right now, is our idle USDC earning a competitive rate, and get me the deepest market analysis you can.”</i>		
1	buys Arc Gas Oracle	\$0.001 SETTLED
2	buys USYC NAV Feed	\$0.004 SETTLED
3	Deep Analysis is \$0.05 – over the limit. Buys Treasury Signal instead.	\$0.008 SETTLED
4	Stops, and escalates to its human:	STOPPED
“...please increase the per-transaction limit to at least \$0.05.”		

\$0.013 spent of a \$0.10 daily budget. No human touched the loop until the agent hit the wall — then it asked, rather than took.

THE ACCOUNT	THE AGENT	THE PROVIDER
Opened by a human only — SIWE or email OTP. An AI can never open one.	Registers itself, and starts at exactly zero allowance.	Lists itself by signing with the address it wants paid at.

We monetize the balance sheet, not the payments.

**Payments are why the balance exists —
deposits are why the business exists.**

Yield share

A spread on USYC treasury yield generated by idle agent balances.

Management fees

Policy engine, auditable ledger and treasury automation as the paid product.

FX & flow fees

Basis points on USDC/EURC rebalancing and cross-chain deposits.

Core metric: TVL held in agent accounts. Neutral by construction — our service registry is open, listings are admitted by an automated probe rather than an approval queue, and every agent marketplace is a channel on top of us, not a competitor.

The bank is built. Next it holds real money.

SHIPPED

JUL 23	Agent wallet · Gateway funding · first x402 nanopayment
JUL 26	Checkpoint 2 — repo + working payment loop
JUL 28	CCTP deposits · USYC auto-sweep · USDC/EURC via Swap
AUG 01	Policy engine · open service registry · agent CLI & keyed API
AUG 02	Deployed and public · one-click run of all four flows

NEXT

AUG 20	Demo Day
Q3	Mainnet counterparties — real USDC against live x402 sellers
Q3	Third-party providers listing themselves into the registry
Q4	Yield share and treasury automation as the paid product
Q4	Multi-agent org accounts — one balance sheet, many spenders
